Subject: RE: Update - Water system disinfection project

According to the WLO, Section 1431 of the SDWA, is an authority that EPA uses to take action if there is an imminent and substantial endangerment to public health as a result of potential or actual contamination of the drinking water supply where the State and local authorities have not taken action to address the endangerment. Section 1431 does not specifically address procurement. Moreover, this is a fact-specific inquiry and requires a record to make the necessary findings. We have considered taking action in East Chicago under 1431 but have not done so due to the actions already underway thru the state and local authorities.

Within the procurement scenario, there are a few potential options to quickly procure an AWG, although option Number 4 may be the only option that would take less than thirty days.

1. EPA could do a justification for other than full and open competition (JOFOC) citing urgent and compelling circumstances (assuming the facts support such an argument). The justification must be publicly posted within 30 days *after* award. EPA could then procure the AWG. I believe it would take the Office of Acquisition Management at least thirty days to accomplish such a task.

2. If the item is only available from one source, the Agency could do a JOFOC based upon Federal Acquisition Regulation 6.302-1 but the justification must be made publicly available for 30 days. My understanding is that there are actually 70 companies worldwide that produce AWG devices so it is doubtful that this exception to competition could be used.

3. The small purchase threshold is \$150,000 and allows for simpler expedited procurement procedures. Not knowing the dollar amount of the AWG being considered, I can't opine on whether it would fit under the small purchase threshold but it is worth noting that even under small purchase procedures, a contracting officer must still ensure that there is adequate competition. This process could easily exceed thirty days.

4. Depending on where the AWG is to be used, i.e., if it is to be used on an existing site

where an EPA contractor is performing under a cost-reimbursable contract, EPA may be able to simply task the incumbent contractor with buying the AWG to assist in performance – the Agency would then simply reimburse the contractor for its costs. Normally, however, we do not dictate the specific manufacturer of equipment to be used by our contractors.

Any exceptions that would let us execute this is the next 30 days?

Elise:

The Administrator has asked that we explore, on an expedited time frame, whether we have authority under SDWA 1431 or any other authority to procure atmospheric water generation machines in short order (30 days) without the typical contracting requirements and without waiting to launch the CRDA. Is this something you could help me track down? If we can find a viable path for this by the end of the week, the Administrator would like Kell to announce the plan on Saturday while in East Chicago, Indiana. Let me know if you would like to discuss further. Thank you!

Best,

David

Hi Kel,

I thought it might be helpful for you to have an update on where the working group got last week prior to our meeting tomorrow so that you could weigh in if anything needs to be adjusted.

Thanks!

Elise

Subject: Update - Water system disinfection project

Hi Elise. We had a great call this afternoon to discuss the water system disinfectant project.

ORD had some great information. Seems that the Army Corp has been working on this water system disinfectant issue for some time – in support of its facilities, including its field facilities.

The Corp is going to start a project in 6 months and are looking forward to having EPA's technical input.

Army Corp has prepared a preliminary report and EPA is trying to get that report. One of the findings discussed with ORD is that the system needs humidity and isn't working well in hot dry Texas.

BTW, the Corp looked at the WaterGen system. Don't know what they thought of it. Should be in the report ORD is trying to get.

Concurrently, ORD wants to look at the types of pathogens that are growing in treatment systems already in use. From several manufacturers. That's because a system needs to run for several months before anything bad has a chance to grow in the system. Sally Gutierrez knows of several of these water systems to test.

Finally, the Army Corp project will run for at least two years. EPA will participate, but Army Corp will lead. ORD may want to run a research project too, but they don't want to duplicate the Corp's efforts. So they will likely coordinate.

So this is our starting point. ORD is taking the technical lead on this end of the project. Tom Speth and Jay Garland and Sally G. will compile a research game plan. Once they do that, Sarah Bauer can engage as the FTTA coordinator and she and I will determine the best vehicle (agreement-wise) to proceed with – be it a CRADA, MOU, or IAG or a combination of agreements.

Makes sense to me to join forces with the Corp and not start from scratch.

We should have the plan of action from ORD by the next phone call. I'm confident this project is in good hands.

As an aside, I worked for Region 2 in the Superfund program for 14 years before becoming an attorney. QA, lab and field auditing, supporting the Site managers and assuring good data. I'm certainly not one of the Research Rock Stars that abound in our incredibly talented ORD, but I'm still technically competent. I love a good science project.

My day is ending. I'll be teleworking on Monday if you want to discuss any of this. Have a nice weekend. - Laura
